John Christian Watson

John Christian Watson (born **John Christian Tanck**; 9 April 1867 – 18 November 1941), commonly known as **Chris Watson**, was an Australian politician who served as the third Prime Minister of Australia.

2. Motivation: Question answering

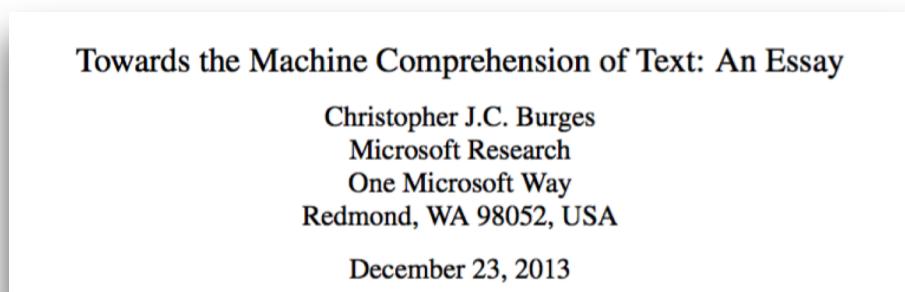

- With massive collections of full-text documents, i.e., the web ☺, simply returning relevant documents is of limited use
- Rather, we often want **answers** to our **questions**
- Especially on mobile
- Or using a digital assistant device, like Alexa, Google Assistant, ...
- We can factor this into two parts:
 1. Finding documents that (might) contain an answer
 - Which can be handled by traditional information retrieval/web search
 - (I teach cs276 next quarter which deals with this problem)
 2. Finding an answer in a paragraph or a document
 - This problem is often termed **Reading Comprehension**
 - It is what we will focus on today

A Brief History of Reading Comprehension

- Much early NLP work attempted reading comprehension
 - Schank, Abelson, Lehnert et al. c. 1977 – “Yale A.I. Project”
- Revived by Lynette Hirschman in 1999:
 - Could NLP systems answer human reading comprehension questions for 3rd to 6th graders? Simple methods attempted.
- Revived again by Chris Burges in 2013 with MCTest
 - Again answering questions over simple story texts
- Floodgates opened in 2015/16 with the production of large datasets which permit supervised neural systems to be built
 - Hermann et al. (NIPS 2015) DeepMind CNN/DM dataset
 - Rajpurkar et al. (EMNLP 2016) SQuAD
 - MS MARCO, TriviaQA, RACE, NewsQA, NarrativeQA, ...

Machine Comprehension (Burges 2013)

- “A machine **comprehends** a passage of **text** if, for any **question** regarding that text that can be **answered** correctly by a majority of native speakers, that machine can provide a string which those speakers would agree both answers that question, and does not contain information irrelevant to that question.”

MCTest Reading Comprehension

Passage (P) + Question (Q) → Answer (A)

P

Alyssa got to the beach after a long trip. She's from Charlotte. She traveled from Atlanta. She's now in Miami. She went to Miami to visit some friends. But she wanted some time to herself at the beach, so she went there first. After going swimming and laying out, she went to her friend Ellen's house. Ellen greeted Alyssa and they both had some lemonade to drink. Alyssa called her friends Kristin and Rachel to meet at Ellen's house.....

Q

Why did Alyssa go to Miami?

A

To visit some friends

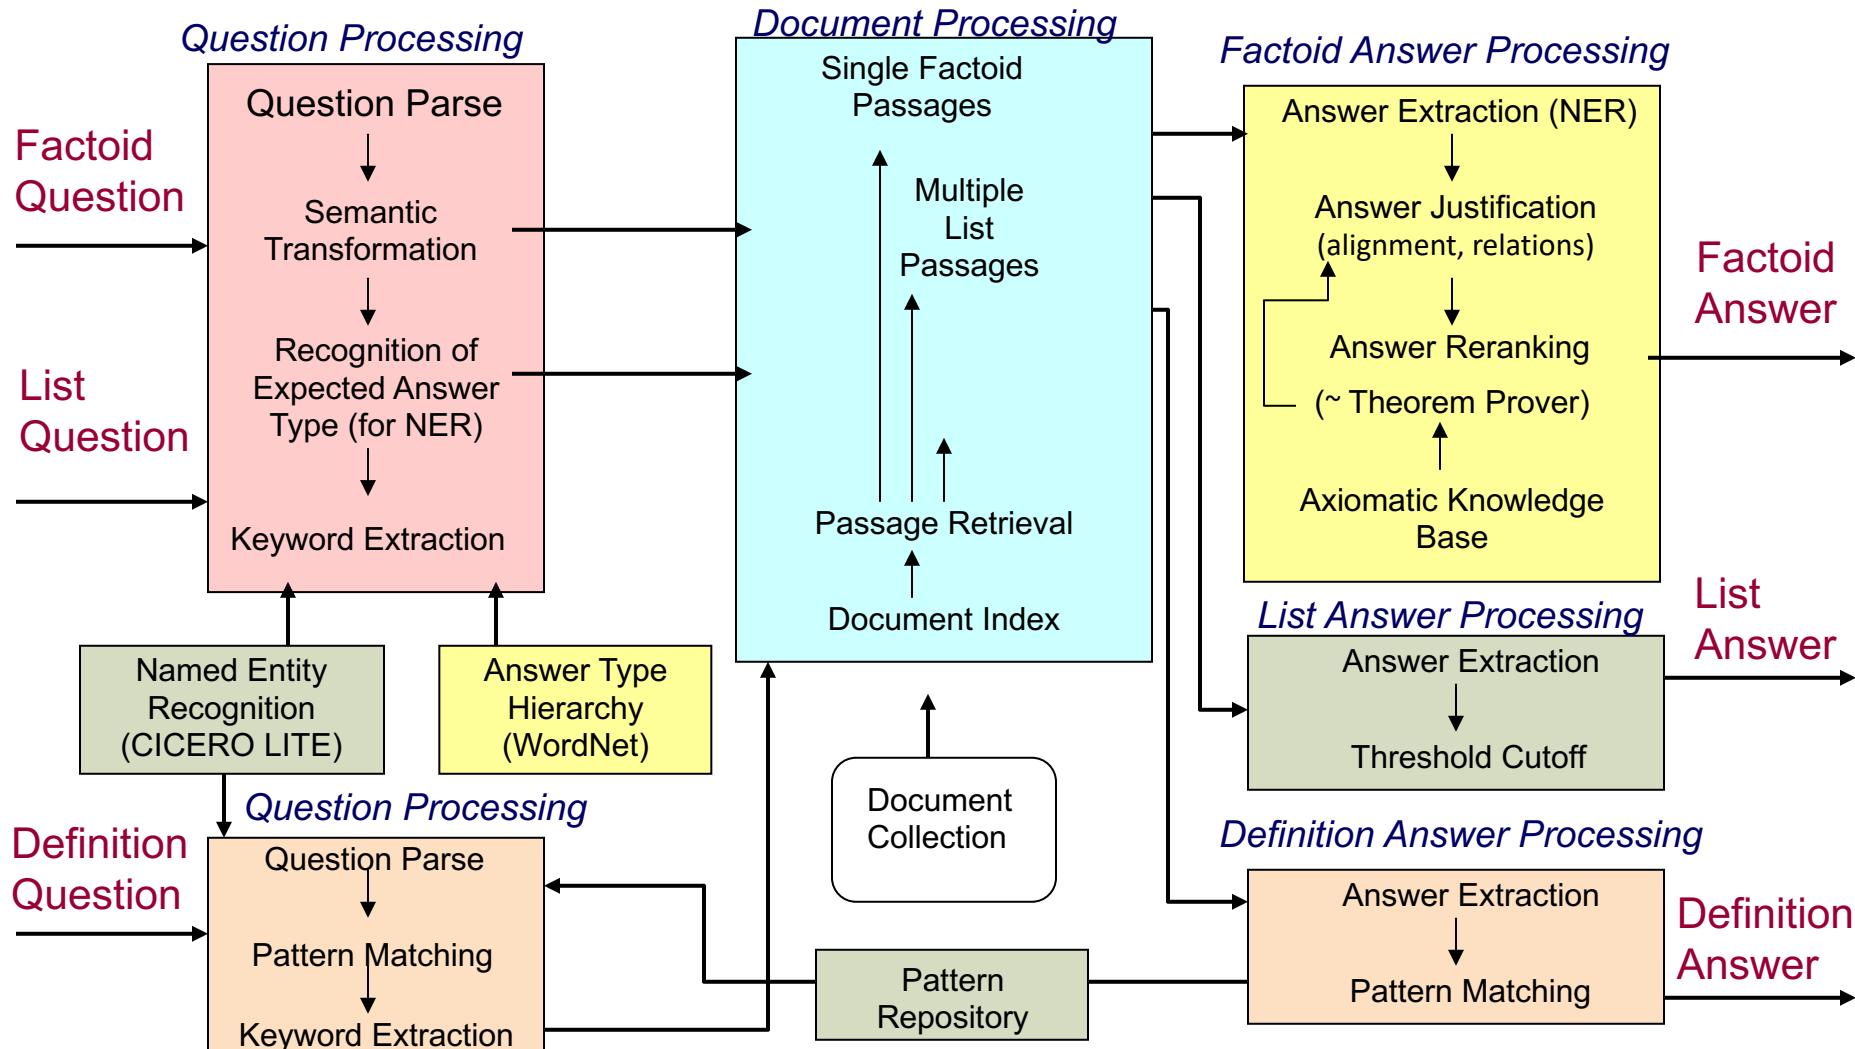

A Brief History of Open-domain Question Answering

- Simmons et al. (1964) did first exploration of answering questions from an expository text based on matching dependency parses of a question and answer
- Murax (Kupiec 1993) aimed to answer questions over an online encyclopedia using IR and shallow linguistic processing
- The NIST TREC QA track begun in 1999 first rigorously investigated answering fact questions over a large collection of documents
- IBM's Jeopardy! System (DeepQA, 2011) brought attention to a version of the problem; it used an ensemble of many methods
- DrQA (Chen et al. 2016) uses IR followed by neural reading comprehension to bring deep learning to Open-domain QA

Turn-of-the Millennium Full NLP QA:

[architecture of LCC (Harabagiu/Moldovan) QA system, circa 2003]

Complex systems but they did work fairly well on “factoid” questions

3. Stanford Question Answering Dataset (SQuAD)

(Rajpurkar et al., 2016)

Question: Which team won Super Bowl 50?

Passage

Super Bowl 50 was an American football game to determine the champion of the National Football League (NFL) for the 2015 season. The American Football Conference (AFC) champion Denver Broncos defeated the National Football Conference (NFC) champion Carolina Panthers 24–10 to earn their third Super Bowl title. The game was played on February 7, 2016, at Levi's Stadium in the San Francisco Bay Area at Santa Clara, California.

100k examples

Answer must be a span in the passage

A.k.a. extractive question answering

Stanford Question Answering Dataset (SQuAD)

Private schools, also known as independent schools, non-governmental, or nonstate schools, are not administered by local, state or national governments; thus, they retain the right to select their students and are funded in whole or in part by charging their students tuition, rather than relying on mandatory taxation through public (government) funding; at some private schools students may be able to get a scholarship, which makes the cost cheaper, depending on a talent the student may have (e.g. sport scholarship, art scholarship, academic scholarship), financial need, or tax credit scholarships that might be available.

Along with non-governmental and nonstate schools, what is another name for private schools?

Gold answers: ① independent ② independent schools ③ independent schools

Along with sport and art, what is a type of talent scholarship?

Gold answers: ① academic ② academic ③ academic

Rather than taxation, what are private schools largely funded by?

Gold answers: ① tuition ② charging their students tuition ③ tuition

SQuAD evaluation, v1.1

- Authors collected 3 gold answers
- Systems are scored on two metrics:
 - Exact match: 1/0 accuracy on whether you match one of the 3 answers
 - F1: Take system and each gold answer as bag of words, evaluate
 $\text{Precision} = \frac{TP}{TP+FP}$, $\text{Recall} = \frac{TP}{TP+FN}$, harmonic mean $F1 = \frac{2PR}{P+R}$
Score is (macro-)average of per-question F1 scores
- F1 measure is seen as more reliable and taken as primary
 - It's less based on choosing exactly the same span that humans chose, which is susceptible to various effects, including line breaks
- Both metrics ignore punctuation and articles (**a, an, the** only)

SQuAD 2.0

- A defect of SQuAD 1.0 is that all questions have an answer in the paragraph
- Systems (implicitly) rank candidates and choose the best one
- You don't have to judge whether a span answers the question
- In SQuAD 2.0, 1/3 of the training questions have no answer, and about 1/2 of the dev/test questions have no answer
 - For NoAnswer examples, NoAnswer receives a score of 1, and any other response gets 0, for both exact match and F1
- Simplest system approach to SQuAD 2.0:
 - Have a threshold score for whether a span answers a question
- Or you could have a second component that confirms answering
 - Like Natural Language Inference (NLI) or “Answer validation”

SQuAD 2.0 Example

Genghis Khan united the Mongol and Turkic tribes of the steppes and became Great Khan in 1206. He and his successors expanded the Mongol empire across Asia. Under the reign of Genghis' third son, Ögedei Khan, the Mongols destroyed the weakened Jin dynasty in 1234, conquering most of northern China. Ögedei offered his nephew Kublai a position in Xingzhou, Hebei. Kublai was unable to read Chinese but had several Han Chinese teachers attached to him since his early years by his mother Sorghaghtani. He sought the counsel of Chinese Buddhist and Confucian advisers. Möngke Khan succeeded Ögedei's son, Güyük, as Great Khan in 1251. He

When did Genghis Khan kill Great Khan?

Gold Answers: <No Answer>

Prediction: 1234 [from Microsoft nInet]

Good systems are great, but still basic NLU errors

The Yuan dynasty is considered both a successor to the Mongol Empire and an imperial Chinese dynasty. It was the khanate ruled by the successors of Möngke Khan after the division of the Mongol Empire. In official Chinese histories, the Yuan dynasty bore the Mandate of Heaven, following the Song dynasty and preceding the Ming dynasty. The dynasty was established by Kublai Khan, yet he placed his grandfather Genghis Khan on the imperial records as the official founder of the

What dynasty came before the Yuan?

Gold Answers: ① Song dynasty ② Mongol Empire
③ the Song dynasty

Prediction: Ming dynasty [BERT (single model) (Google AI)]

SQuAD limitations

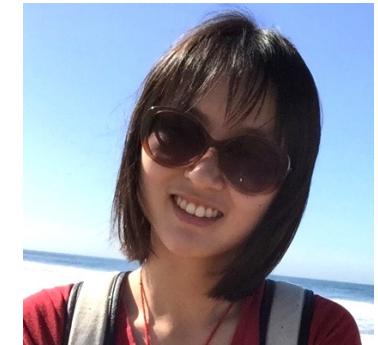

- SQuAD has a number of other key limitations too:
 - Only span-based answers (no yes/no, counting, implicit why)
 - Questions were constructed looking at the passages
 - Not genuine information needs
 - Generally greater lexical and syntactic matching between questions and answer span than you get IRL
 - Barely any multi-fact/sentence inference beyond coreference
- Nevertheless, it is a well-targeted, well-structured, clean dataset
 - It has been the most used and competed on QA dataset
 - It has also been a useful starting point for building systems in industry (though in-domain data always really helps!)
 - And we're using it (SQuAD 2.0)

4. Stanford Attentive Reader

[Chen, Bolton, & Manning 2016]

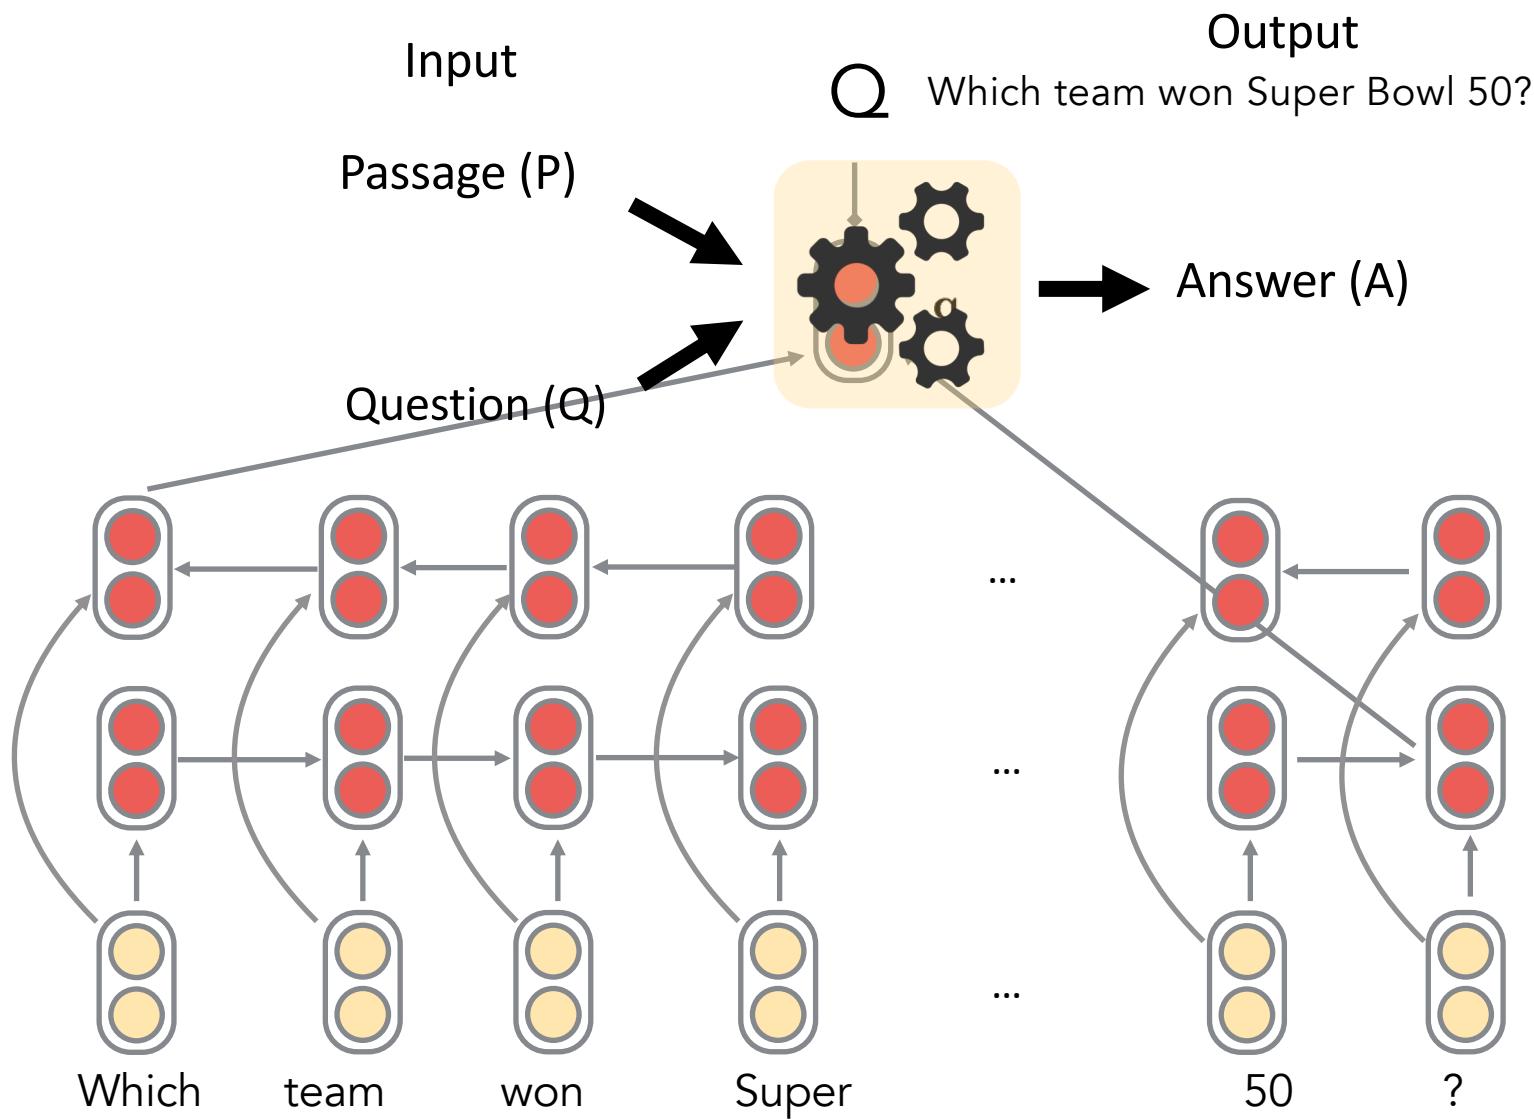

[Chen, Fisch, Weston & Bordes 2017] DrQA

[Chen 2018]

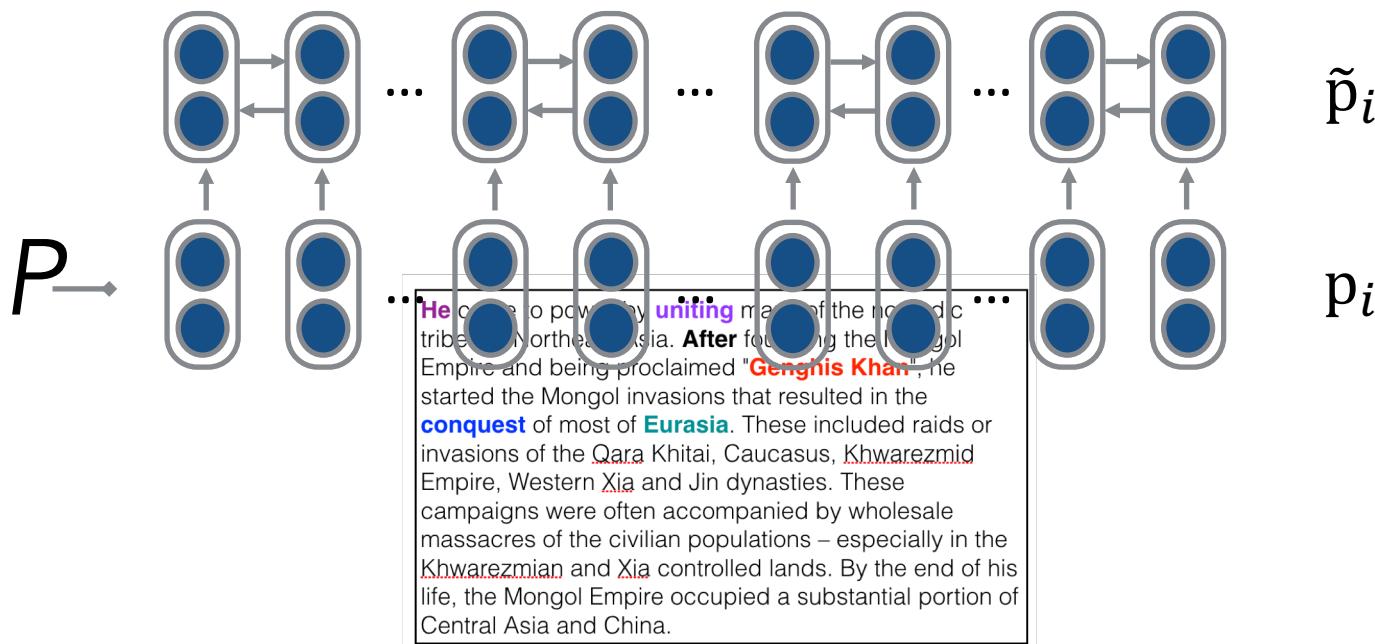

- Demonstrated a minimal, highly successful architecture for reading comprehension and question answering
- Became known as the Stanford Attentive Reader

The Stanford Attentive Reader

Stanford Attentive Reader

Bidirectional LSTMs

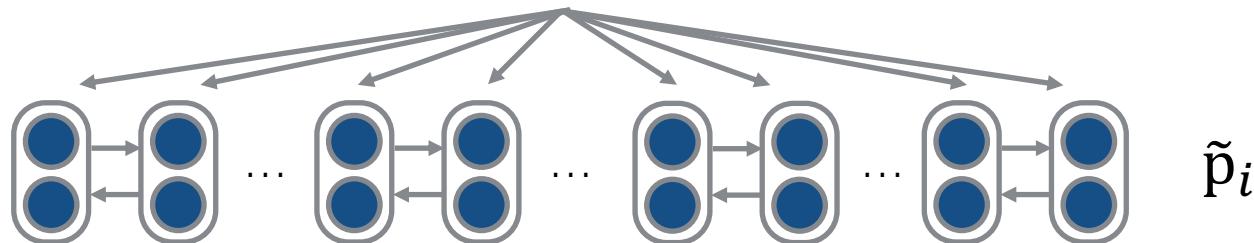

Stanford Attentive Reader

Bidirectional LSTMs

Q

Who did **Genghis Khan** unite before he began **conquering** the rest of **Eurasia**?

q

Attention

$$\alpha_i = \text{softmax}_i(\mathbf{q}^T \mathbf{W})$$

He came to power by **uniting** many of the nomadic tribes of Northeast Asia. **After** founding the Mongol Empire and being proclaimed "**Genghis Khan**", he started the Mongol invasions that resulted in the **conquest** of most of **Eurasia**. These included raids or invasions of the Qara Khitai, Caucasus, Khwarezmid Empire, Western Xia and Jin dynasties. These campaigns were often accompanied by wholesale massacres of the civilian populations – especially in the Khwarezmian and Xia controlled lands. By the end of his life, the Mongol Empire occupied a substantial portion of Central Asia and China.

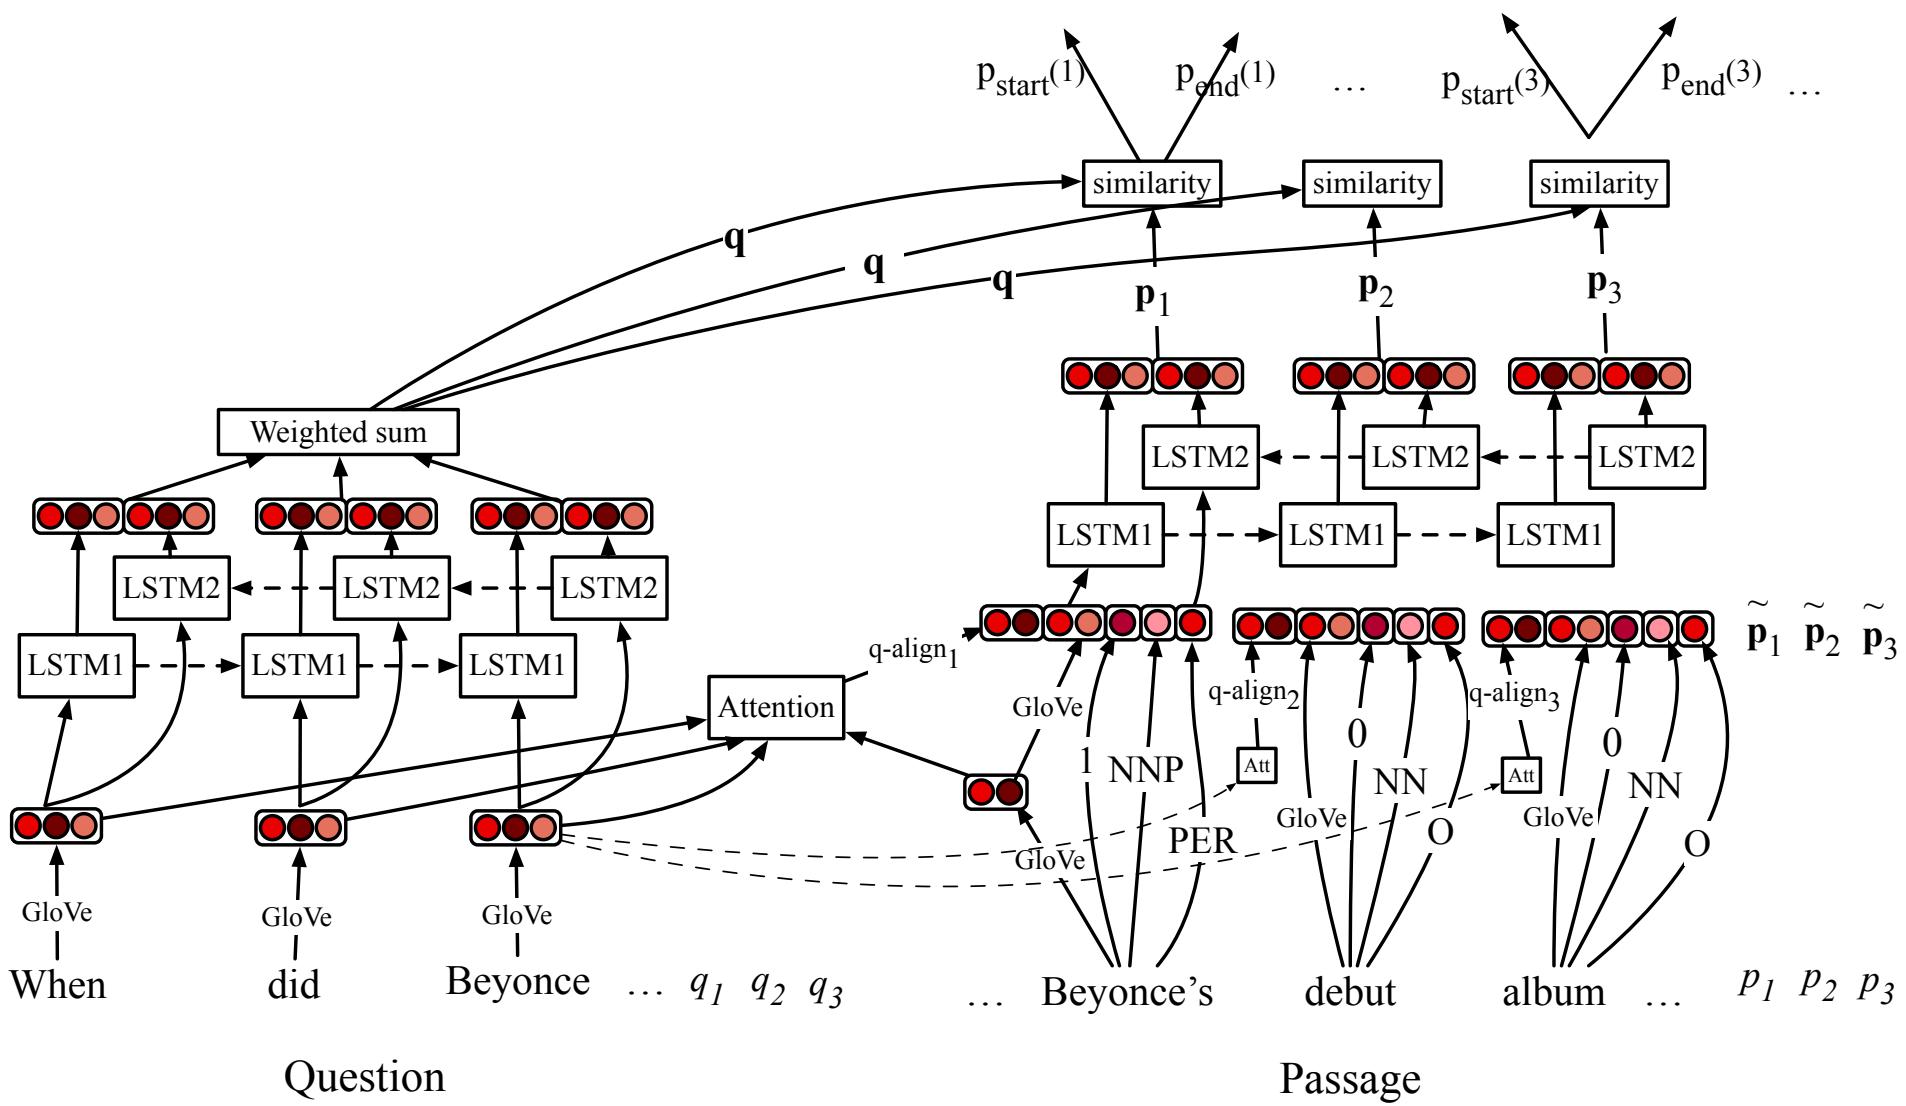

Attention

$$\alpha'_i = \text{softmax}_i(\mathbf{q}^T \mathbf{W}'_s \tilde{p}_i)$$

Stanford Attentive Reader++

Training objective:

$$\mathcal{L} = - \sum \log P^{(\text{start})}(a_{\text{start}}) - \sum \log P^{(\text{end})}(a_{\text{end}})$$

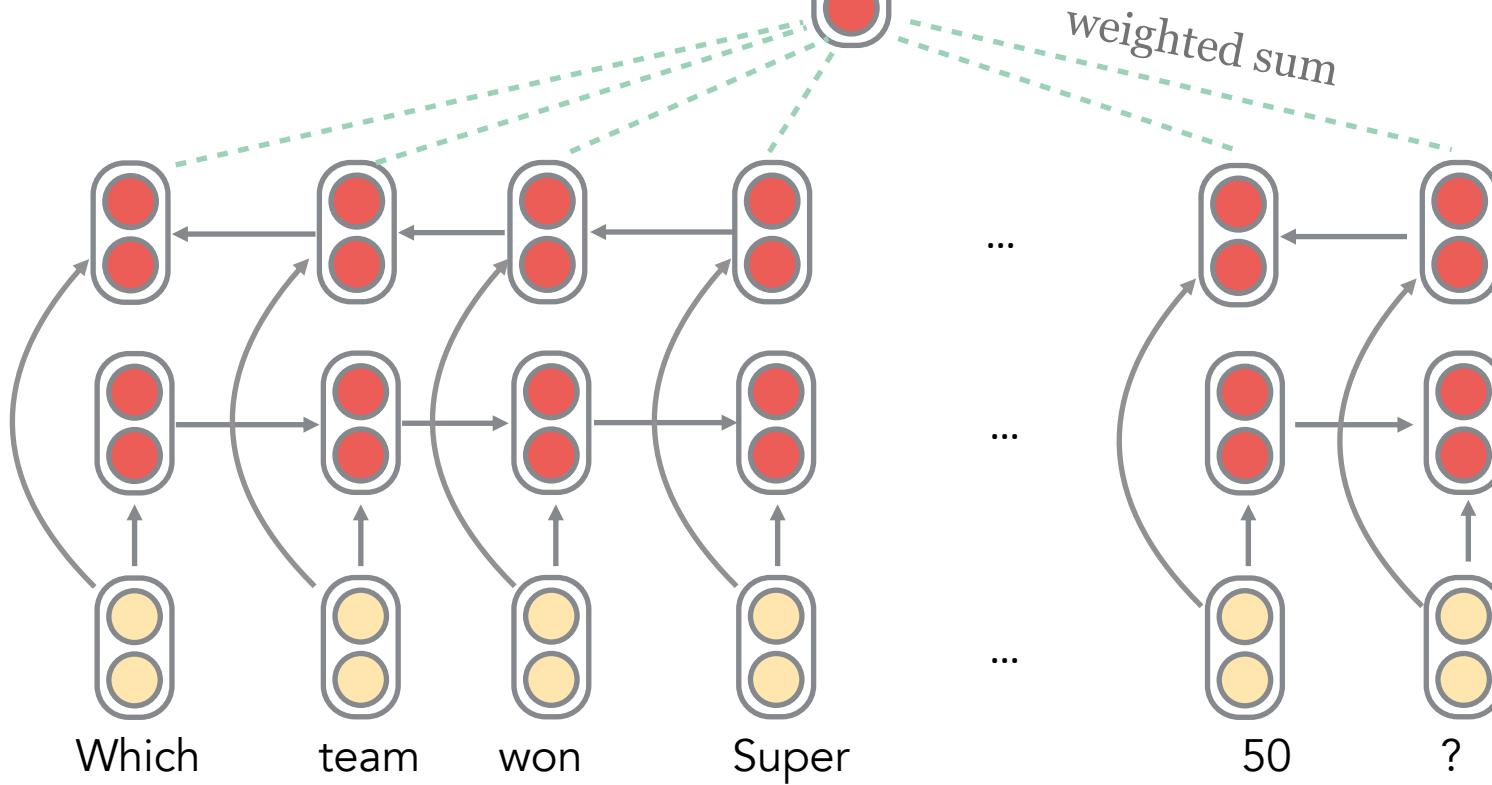

Stanford Attentive Reader++

$$\mathbf{q} = \sum_j b_j \mathbf{q}_j$$

For learned \mathbf{w} , $b_j = \frac{\exp(\mathbf{w} \cdot \mathbf{q}_j)}{\sum_{j'} \exp(\mathbf{w} \cdot \mathbf{q}_{j'})}$

Q Which team won Super Bowl 50?
 \mathbf{q}

Deep 3 layer BiLSTM
is better!

Stanford Attentive Reader++

- \mathbf{p}_i : Vector representation of each token in passage

Made from concatenation of

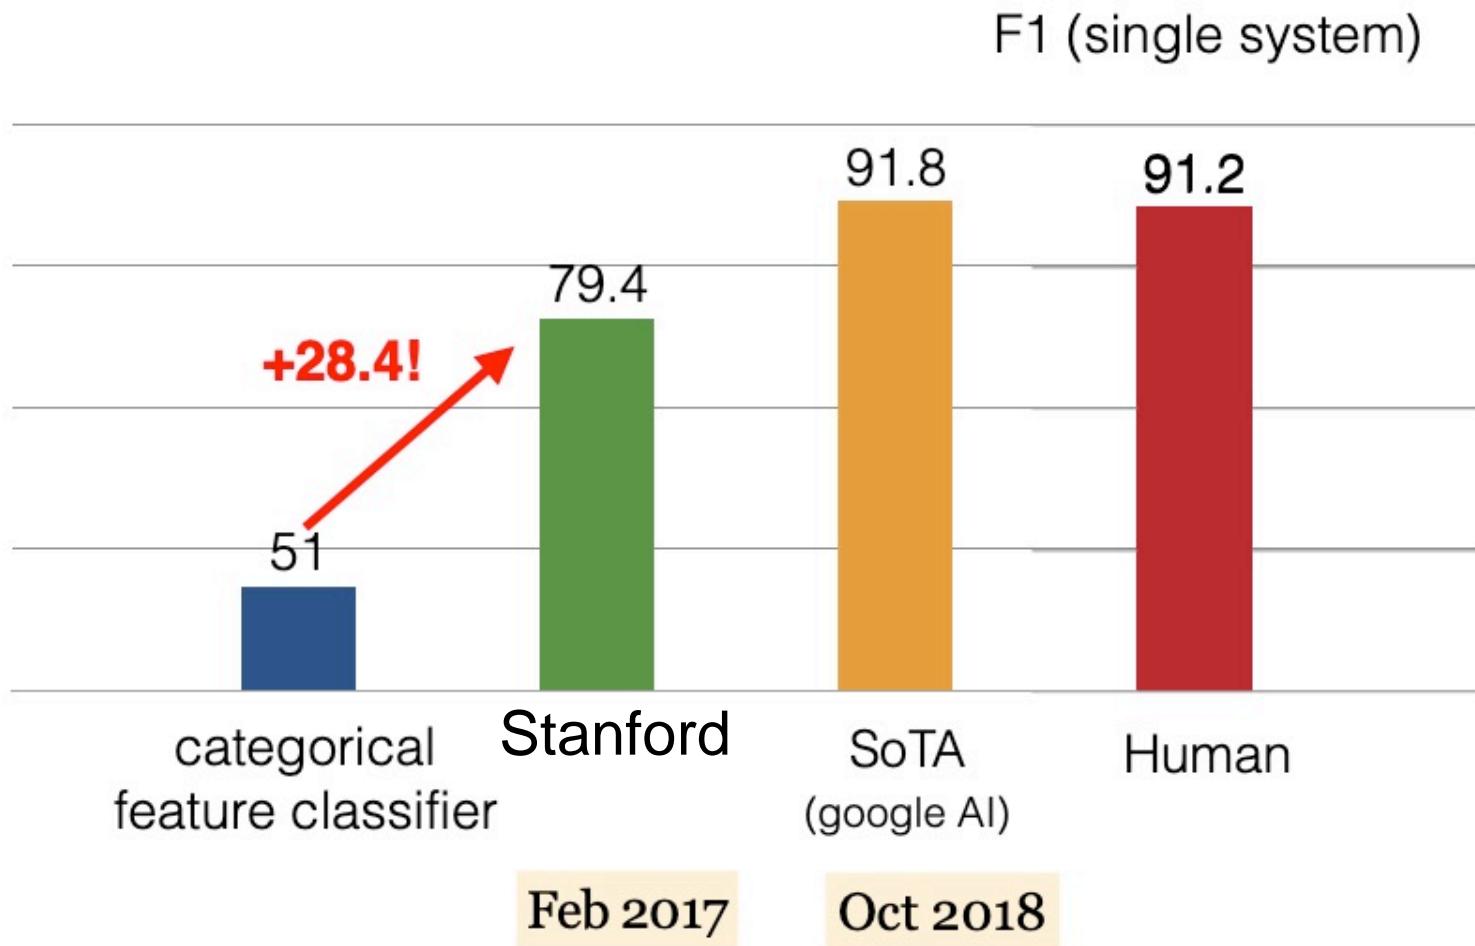

- Word embedding (GloVe 300d)
- Linguistic features: POS & NER tags, one-hot encoded
- Term frequency (unigram probability)
- Exact match: whether the word appears in the question
 - 3 binary features: exact, uncased, lemma
- Aligned question embedding (“car” vs “vehicle”)

$$f_{align}(p_i) = \sum_j a_{i,j} \mathbf{E}(q_j)$$

$$q_{i,j} = \frac{\exp(\alpha(\mathbf{E}(p_i)) \cdot \alpha(\mathbf{E}(q_j)))}{\sum_{j'} \exp(\alpha(\mathbf{E}(p_i)) \cdot \alpha(\mathbf{E}(q'_j)))}$$

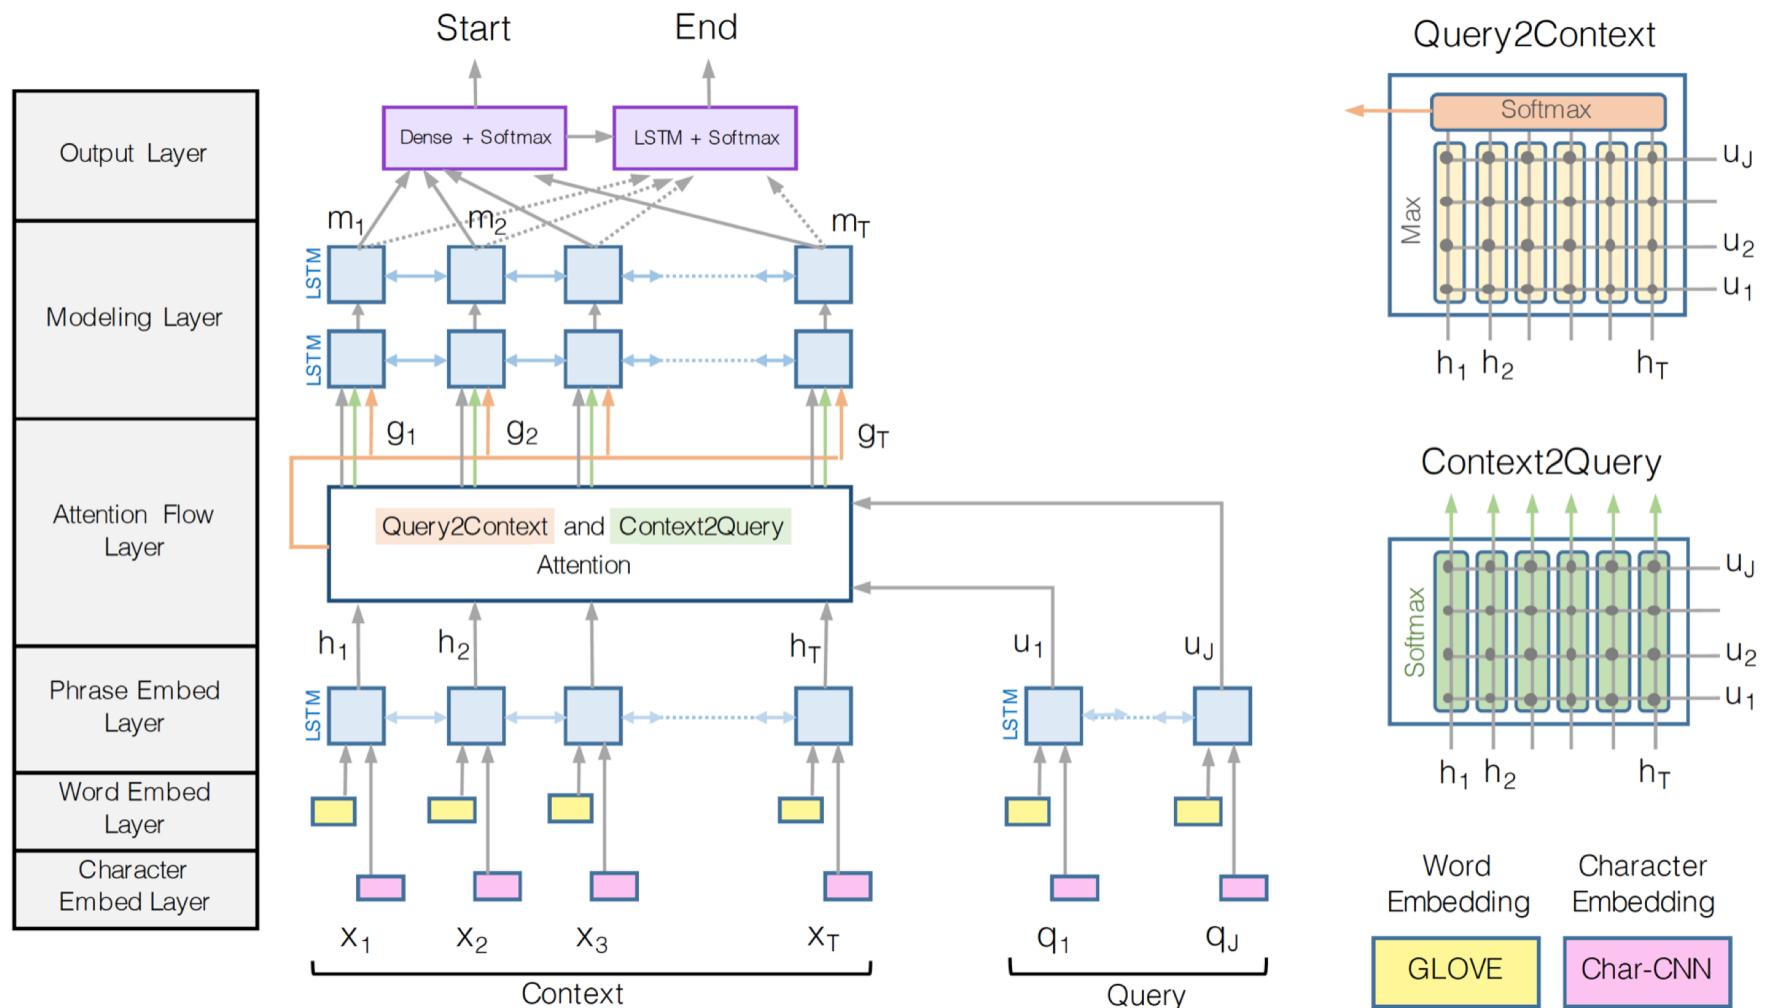

Where α is a simple one layer FFNN

A big win for neural models

5. BiDAF: Bi-Directional Attention Flow for Machine Comprehension

(Seo, Kembhavi, Farhadi, Hajishirzi, ICLR 2017)

BiDAF

- There are variants of and improvements to the BiDAF architecture over the years, but the central idea is **the Attention Flow layer**
- **Idea:** attention should flow both ways – from the context to the question and from the question to the context
- Make similarity matrix (with \mathbf{w} of dimension $6d$):

$$\mathbf{S}_{ij} = \mathbf{w}_{\text{sim}}^T [\mathbf{c}_i; \mathbf{q}_j; \mathbf{c}_i \circ \mathbf{q}_j] \in \mathbb{R}$$

- Context-to-Question (C2Q) attention:
(which query words are most relevant to each context word)

$$\alpha^i = \text{softmax}(\mathbf{S}_{i,:}) \in \mathbb{R}^M \quad \forall i \in \{1, \dots, N\}$$

$$\mathbf{a}_i = \sum_{j=1}^M \alpha_j^i \mathbf{q}_j \in \mathbb{R}^{2h} \quad \forall i \in \{1, \dots, N\}$$

BiDAF

- **Attention Flow Idea:** attention should flow both ways – from the context to the question and from the question to the context
- Question-to-Context (Q2C) attention:
(the weighted sum of the most important words in the context with respect to the query – slight asymmetry through max)

$$\mathbf{m}_i = \max_j S_{ij} \in \mathbb{R} \quad \forall i \in \{1, \dots, N\}$$

$$\beta = \text{softmax}(\mathbf{m}) \in \mathbb{R}^N$$

$$\mathbf{c}' = \sum_{i=1}^N \beta_i \mathbf{c}_i \in \mathbb{R}^{2h}$$

- For each passage position, output of BiDAF layer is:

$$\mathbf{b}_i = [\mathbf{c}_i; \mathbf{a}_i; \mathbf{c}_i \circ \mathbf{a}_i; \mathbf{c}_i \circ \mathbf{c}'] \in \mathbb{R}^{8h} \quad \forall i \in \{1, \dots, N\}$$

BiDAF

- There is then a “modelling” layer:
 - Another deep (2-layer) BiLSTM over the passage
- And answer span selection is more complex:
 - Start: Pass output of BiDAF and modelling layer concatenated to a dense FF layer and then a softmax
 - End: Put output of modelling layer M through another BiLSTM to give M_2 and then concatenate with BiDAF layer and again put through dense FF layer and a softmax

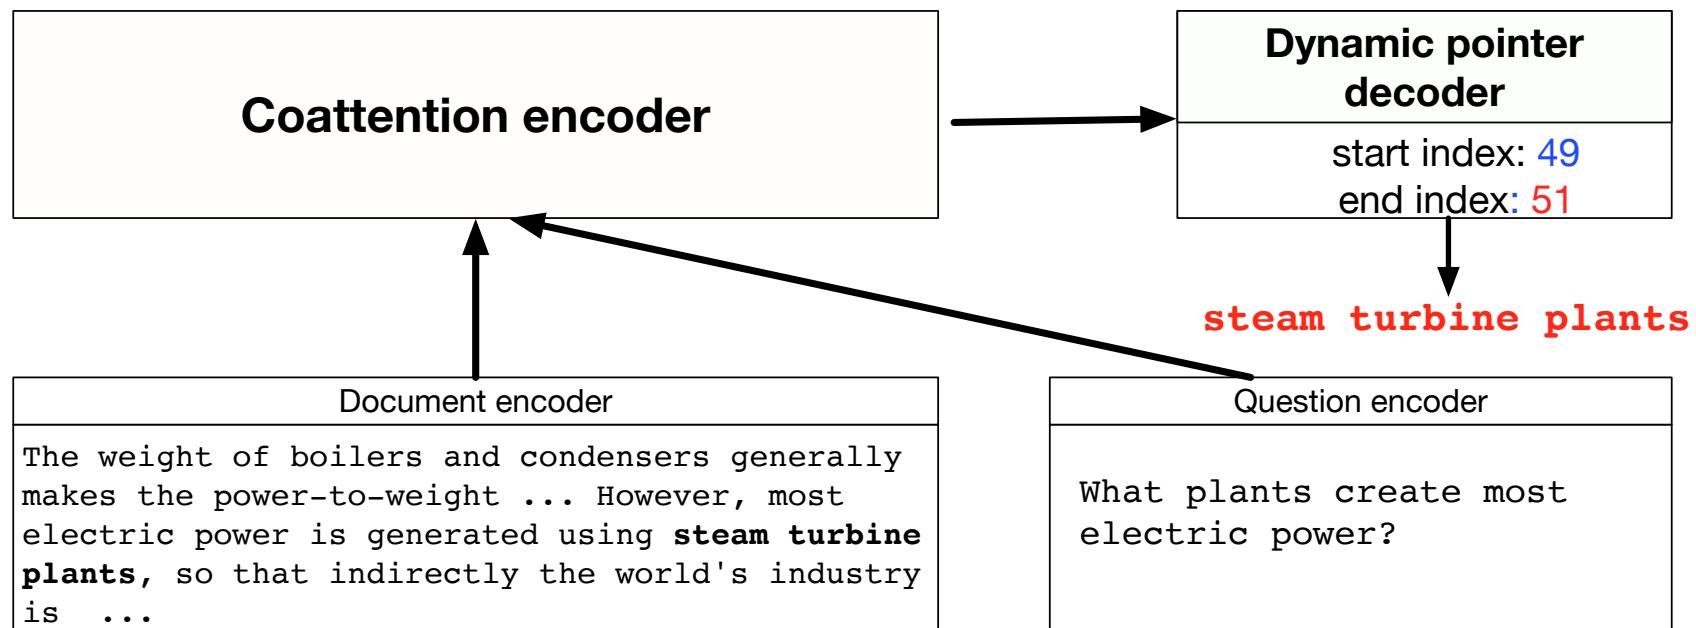

6. Recent, more advanced architectures

- Most of the work in 2016, 2017, and 2018 employed progressively more complex architectures with a multitude of variants of attention – often yielding good task gains

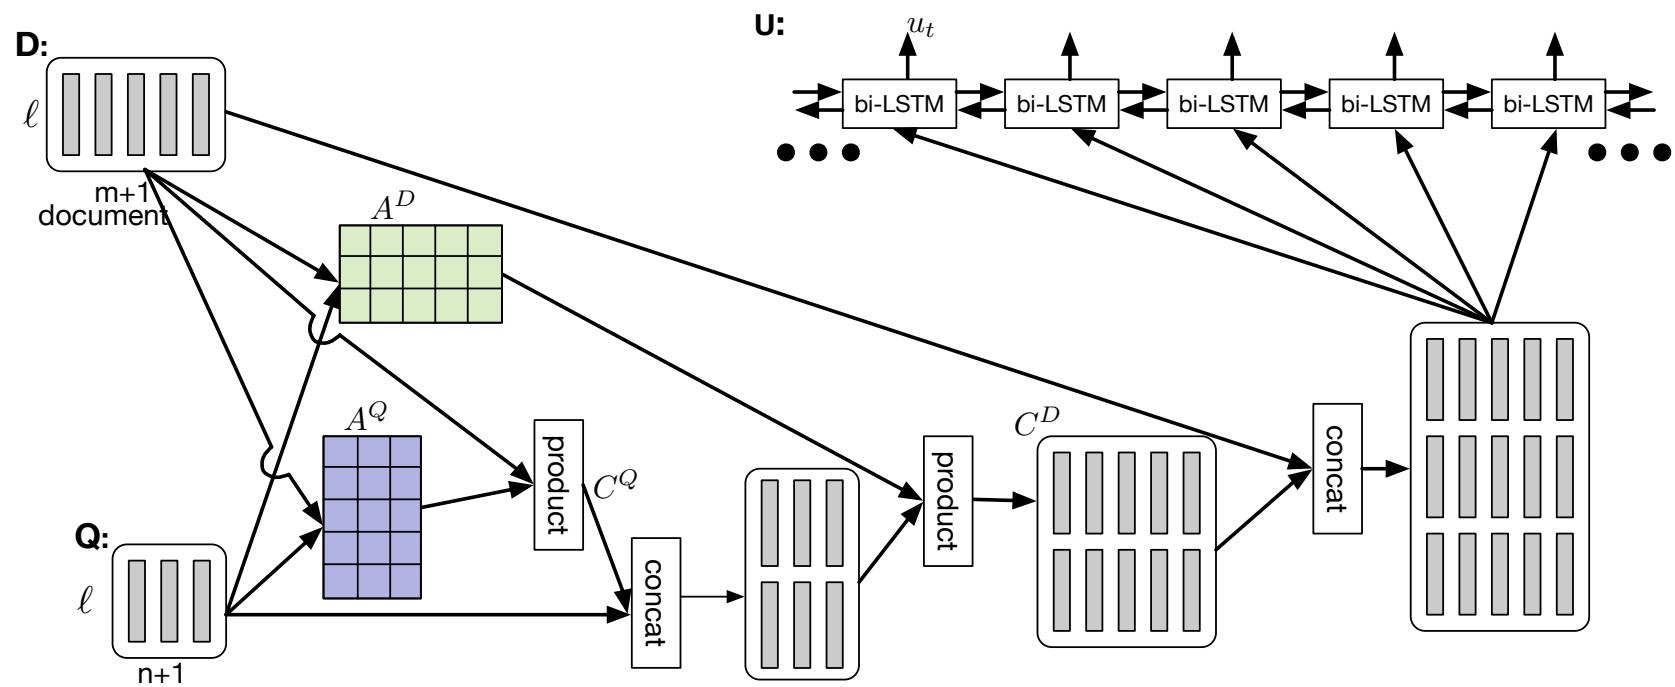

Dynamic Coattention Networks for Question Answering

(Caiming Xiong, Victor Zhong, Richard Socher ICLR 2017)

- Flaw: Questions have input-independent representations
- Interdependence needed for a comprehensive QA model

Coattention Encoder

Coattention layer

- Coattention layer again provides a two-way attention between the context and the question
- However, coattention involves a second-level attention computation:
 - attending over representations that are themselves attention outputs
- We use the C2Q attention distributions α_i to take weighted sums of the Q2C attention outputs \mathbf{b}_j . This gives us second-level attention outputs \mathbf{s}_i :

$$\mathbf{s}_i = \sum_{j=1}^{M+1} \alpha_j^i \mathbf{b}_j \in \mathbb{R}^l \quad \forall i \in \{1, \dots, N\}$$

Co-attention: Results on SQuAD Competition

FusionNet (Huang, Zhu, Shen, Chen 2017)

Attention functions

MLP (Additive) form:

$$S_{ij} = s^T \tanh(W_1 c_i + W_2 q_j)$$

Space: $O(mnk)$, W is $k \times d$

Bilinear (Product) form:

$$S_{ij} = c_i^T W q_j$$

$$S_{ij} = c_i^T U^T V q_j$$

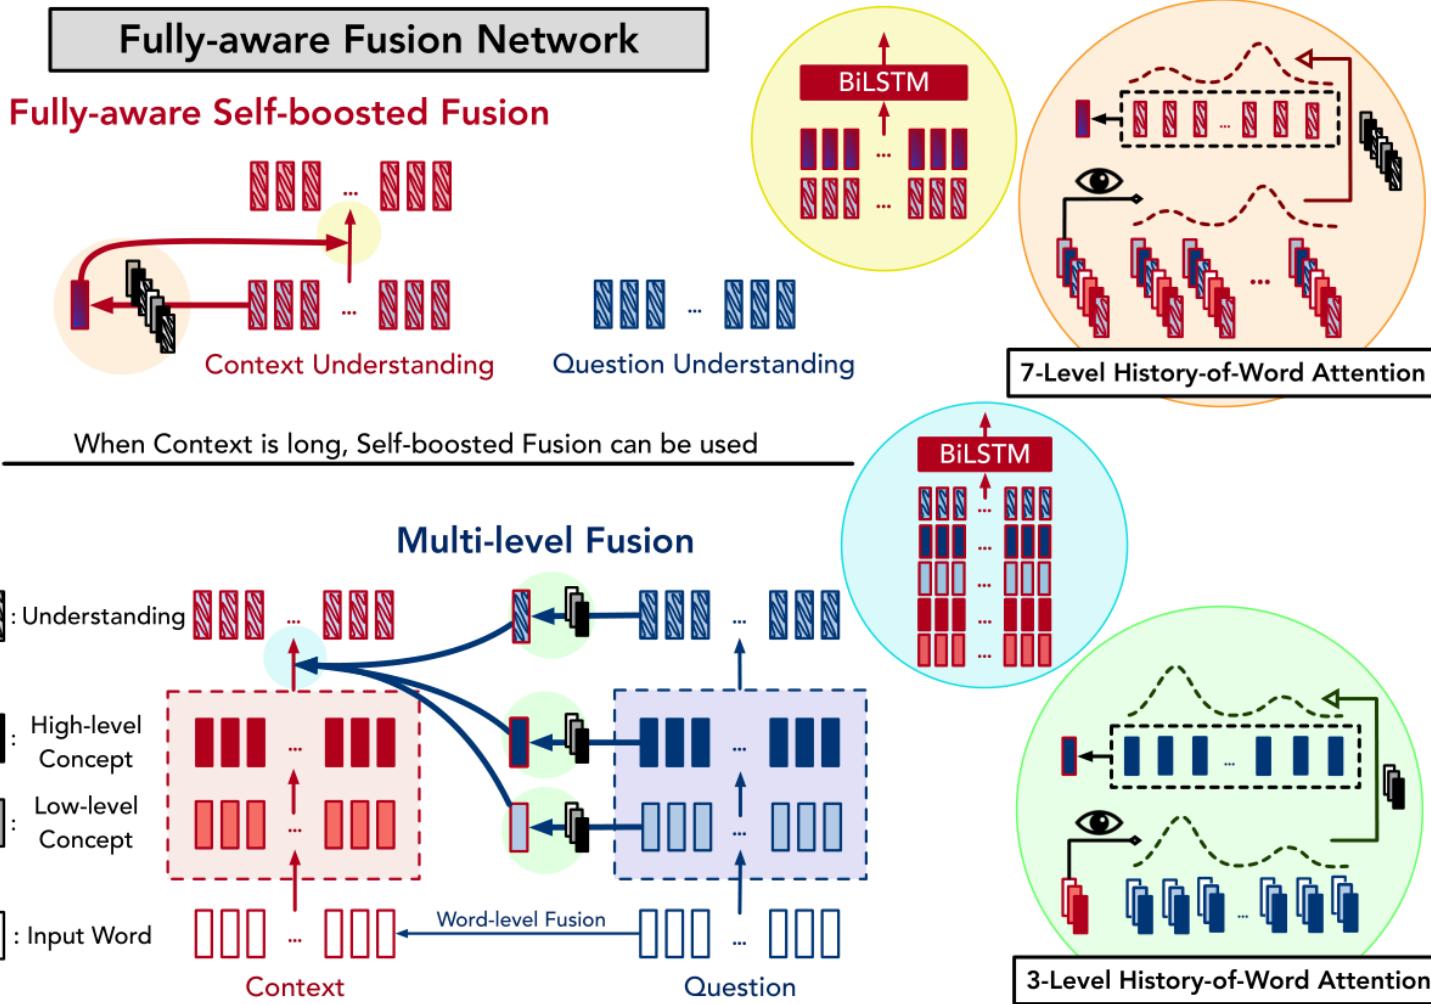

Space: $O((m+n)k)$

$$S_{ij} = c_i^T W^T D W q_j$$

1. Smaller space
2. Non-linearity

$$S_{ij} = \text{Relu}(c_i^T W^T) D \text{Relu}(W q_j)$$

FusionNet tries to combine many forms of attention

Multi-level inter-attention

$$\{\mathbf{m}_i^{(k),C}\}_{i=1}^m = \text{Attn}(\{\text{HoW}_i^C\}_{i=1}^m, \{\text{HoW}_i^Q\}_{i=1}^n, \{\mathbf{h}_i^{Q,k}\}_{i=1}^n), 1 \leq k \leq K + 1$$

$$\text{HoW}_i^C = [\text{GloVe}(w_i^C); \text{BERT}_{w_i^C}; \mathbf{h}_i^{C,1}; \dots, \mathbf{h}_i^{C,k}],$$

$$\text{HoW}_i^Q = [\text{GloVe}(w_i^Q); \text{BERT}_{w_i^Q}; \mathbf{h}_i^{Q,1}; \dots, \mathbf{h}_i^{Q,k}].$$

After multi-level inter-attention, use RNN, self-attention and another RNN to obtain the final representation of context: $\{\mathbf{u}_i^c\}$

Recent, more advanced architectures

- Most of the work in 2016, 2017, and 2018 employed progressively more complex architectures with a multitude of variants of attention – often yielding good task gains

The diagram illustrates a BiDAF-like architecture. It features two parallel stacks of layers: one for 'Context' (blue) and one for 'Question' (red). Each stack consists of four layers, each containing a recurrent unit (indicated by a wavy arrow). The 'Context' stack processes input tokens from left to right, while the 'Question' stack processes them from right to left. Bidirectional arrows connect corresponding layers between the two stacks, representing the flow of information during the attention mechanism. The layers are labeled (1), (2), (2'), and (3) from bottom to top.

7. ELMo and BERT preview

Contextual word representations

Using language model-like objectives

Elmo

(Peters et al, 2018)

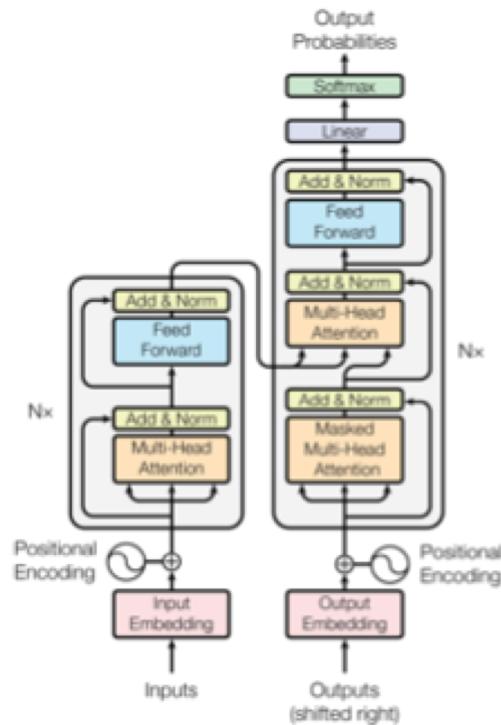

Bert

(Devlin et al, 2018)

Look at SDNet as an example of how to use BERT as submodule: <https://arxiv.org/abs/1812.03593>

The transformer architecture used in BERT is sort of attention on steroids. More later!

(Vaswani et al, 2017)

Warsaw

From Wikipedia, the free encyclopedia

This article is about the Polish capital. For other uses, see [Warsaw \(disambiguation\)](#).

"[City of Warsaw](#)" redirects here. For other uses, see [Warszawa \(disambiguation\)](#).

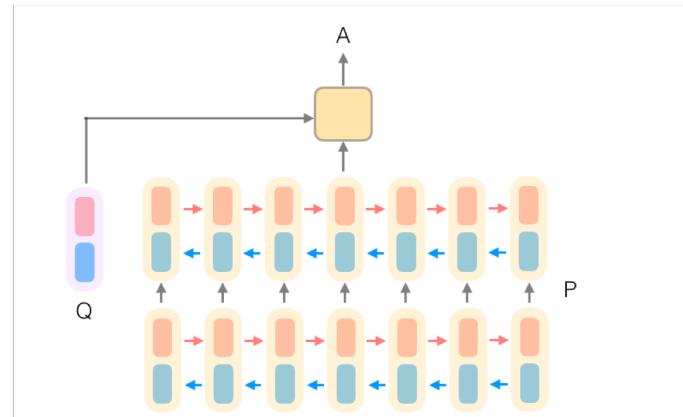

"[City of Warsaw](#)" redirects here. For the Second World War fighter squadron, see [No. 316 Polish Fighter Squadron](#). For the 1934, see [Admiovicz brothers](#).

Warsaw (Polish: [Warszawa](#) [varˈʂava] (listen); see also other names) is the capital and largest city of Poland. It stands on the Vistula River in east-central Poland, roughly 260 kilometres (160 mi) from the Baltic Sea and 300 kilometres (190 mi) from the Carpathian Mountains. Its population is estimated at 1.750 million residents within a greater metropolitan area of 3.105 million residents, which makes Warsaw the 9th most populous capital city in the European Union.^[1] The city limits cover 516.9 square kilometres (199.6 sq mi), while the metropolitan area covers 6,100.43 square kilometres (2,356.39 sq mi).^[2]

In 2014, Warsaw was ranked as the 22nd most livable city in the world.^[3] It was also ranked as one of the most livable cities in Central Europe. Today Warsaw is considered an "Alpha+" global city, a major international tourist destination and a significant cultural, political and economic hub.^{[4][5]} Warsaw's economy, by a wide variety of industries, is characterized by FDI manufacturing, metal processing, steel and electronic manufacturing and food products. The city is a significant centre of research and development, BPO, ITD, as well as of financial services. The Warsaw Stock Exchange is the second largest and most liquid market in Central and Eastern Europe.^[6] Moreover, the European Central Bank has its headquarters in Warsaw. It has been said that Warsaw, together with Frankfurt, London, Paris and Berlin, is one of the cities with the highest number of skyscrapers in the European Union.^[7] Warsaw has also been called "Eastern Europe's chic cultural capital with thriving art and club scenes and serious restaurants".^[8]
